Hello, my name is Rod Gaitan. I am 12 years old and 1.651 meters tall.

In 5 years, I will be 17 years old.

The area of a 5.5 x 2 rectangle is 11.0

My initial investment of \$100000 will generate a total of \$103917.64 in the term of 1 year(s) on a CD with 0.0388 APY!

yoohool yoohool yoohool yoohool yoohool

Logs for 'simple_calculator.py':

```
6 ## VERSION 1: Asks the user to input two numbers (use two separate input() calls). Make sure to convert these inputs from strings
7 #num1 = int(input("Please enter the first number: ")) # takes 1st input and casts it to integer. Had to remove, it conflicts w/ is
8 #num2 = int(input("Please enter the second number: ")) # takes 1st input and casts it to integer. Had to remove, it conflicts w/ i
9 num1 = input("Please enter the first number: ") # takes 1st input, no casting input to integer here.
10 num2 = input("Please enter the second number: ") # takes 2nd input, no casting input to integer here.
11
12 ## Asks the user to choose an operation (e.g., addition, subtraction, multiplication, division). This can be a simple prompt like
13 operator = input("Please choose operator: ") # allows you to select the operator, but in this case, it's limited to only multiplic
14
15 ## Performs the chosen operation on the two numbers:
16 # if num1.isdigit() == False or num2.isdigit() == False: # this code line implements 'isdigit()' & works but goes against DRY code
17 if not num1.isdigit() or not num2.isdigit(): # # this code line implements 'isdigit()' as a better technique
18     print("Please enter a valid input!")
19 else:
20     num1 = int(num1)
21     num2 = int(num2)
22
23     if operator == '+':

Logs for 'string_fun.py':

The screenshot shows a Visual Studio Code editor window with the file explorer on the left and the code editor in the center. The file explorer shows a project named '2026 Python Essentials' with a subfolder '2026-cax-216'. The file 'string_fun.py' is selected. The code editor shows the following Python code:

```
1 print()  
2 ##### Part 3 #####  
3  
4 word = input("Please provide a word: ") # Prompts the user for a word.  
5 # print(word)  
6 print(len(word)) # Prints the length of the word.  
7 print(word.upper()) # Prints the word in all uppercase.  
8 print(word * 3) # Prints the word repeated 3 times (on the same line or separate lines).  
9
```

The terminal at the bottom shows the execution of the script. The prompt is 'Please provide a word: hi'. The output is '2', 'HI', and 'hihihi'.

```
